Projekttitel/aspekt	NKR for forebyggelse og behandling af organisk delir - Guidelines
Fagkonsulent / projektleder	Maria Dawids/ Maria Herlev Ahrenfeldt, SST
Søgespecialist	Tove Faber Frandsen, Videncentret, Odense Universitetshospital
Senest opdateret	28. oktober 2015

Baggrund	<p>Organisk delir (delir ved somatisk sygdom) er en alvorlig og hyppigt forekommende konfusionstilstand, der ofte ses hos alvorligt syge og ældre medicinske patienter. Udover kognitive forstyrrelser vil patienter med organisk delir ofte udvise svære adfærdsforstyrrelser og psykoselignende symptomer. Organisk delir er en progredierende tilstand, der kan udvikle sig over timer til få dage, hvor multimorbiditet, kognitiv dysfunktion og medikamentel behandling er disponerende faktorer. Tilstanden overses ofte, hvilket kan medføre forlænget indlæggelsestid, yderligere funktionstab og øget brug af medicin samt – i yderste konsekvens - en akut og livstruende tilstand.</p> <p>Organisk delir er særligt hyppigt forekommende hos beboere på plejecentre og hos patienter under indlæggelse på såvel medicinske som kirurgiske afdelinger, hvor forekomsten skønnes at være mellem 10 og 50 %. Når delir opstår under indlæggelse, behandles patientens delir typisk af de pågældende somatiske eller kirurgiske specialer, eventuelt efter rådgivning fra psykiatrien. Behandlingen består sædvanligvis i at behandle den underliggende sygdom og begrænse/seponere lægemidler, som man har en formodning om kan være udløsende for delirium.</p> <p>Det er muligt at undgå udviklingen af organisk delir, hvis patienter, der er i risiko for at udvikle tilstanden, identificeres tidligt og behandles relevant.</p> <p>Den nationale kliniske retningslinje skal derfor give evidensbaserede anbefalinger for forebyggelse, opsporing og behandling af organisk delir.</p>
