## Lemmens 2015

<b>Methods</b>	<p><b>Study design:</b> Randomized controlled trial</p> <p><b>Study grouping:</b> Parallel group</p> <p><b>Open Label:</b></p> <p><b>Cluster RCT:</b></p>
<b>Participants</b>	<p><b>Baseline Characteristics</b></p> <p>IPT</p> <ul style="list-style-type: none"> <li>● <i>Dep. sværhedsgrad:</i> BDI II: 31.2 (8.9)</li> </ul> <p>KAT</p> <ul style="list-style-type: none"> <li>● <i>Dep. sværhedsgrad:</i> BDI II: 31.2 (8.9)</li> </ul> <p><b>Included criteria:</b> Patients were adult outpatients (18–65 years<sup>3</sup>) referred to the mood disorder unit of the Maastricht Community Mental Health Centre with a primary diagnosis of MDD as confirmed by the Structural Clinical Interview for DSM-IV Axis I disorders (SCID-I; First et al. 1997) conducted by a trained evaluator. Further inclusion criteria were: internet access, an email address, and sufficient knowledge of the Dutch language.</p> <p><b>Excluded criteria:</b> Exclusion criteria were: bipolar or chronic (current episode &gt;5 years) depression, elevated acute suicide risk, concomitant pharmacological or psychological treatment<sup>4</sup>, drugs and alcohol abuse/dependence, and mental retardation (IQ &lt; 80).</p> <p><b>Pretreatment:</b> There were no relevant differences between the patients in the two treatment conditions combined and the WLC condition for any of the sociodemographic variables or depression specifiers. However CT and IPT showed considerable differences on the BDI-II and EQ-5D. Therefore, we controlled for this in all analyses</p>
<b>Interventions</b>	<p><b>Intervention Characteristics</b></p> <p>IPT</p> <ul style="list-style-type: none"> <li>● <i>Beskrivelse:</i> Treatment consisted of 16–20 individual sessions of 45 min, depending on the progress of the individual patient. The IPT protocol followed the guidelines laid out by Klerman et al. (1984).</li> </ul> <p>KAT</p> <ul style="list-style-type: none"> <li>● <i>Beskrivelse:</i> Treatment consisted of 16–20 individual sessions of 45 min, depending on the progress of the individual patient. The CT protocol was</li> </ul>

	based on the manual by Beck et al. (1979).
<b>Outcomes</b>	<p><i>Livskvalitet, Længste follow-up (min. ½ år)</i></p> <ul style="list-style-type: none"> <li>● <b>Outcome type:</b> ContinuousOutcome</li> <li>● <b>Direction:</b> Higher is better</li> </ul> <p><i>Remissionsrate, Efter endt behandling</i></p> <ul style="list-style-type: none"> <li>● <b>Outcome type:</b> DichotomousOutcome</li> <li>● <b>Direction:</b> Higher is better</li> </ul> <p><i>Recidiv, Længste follow-up (min. ½ år)</i></p> <ul style="list-style-type: none"> <li>● <b>Outcome type:</b> DichotomousOutcome</li> <li>● <b>Direction:</b> Lower is better</li> </ul> <p><i>Funktionsevne, Længste follow-up (min. ½ år)</i></p> <ul style="list-style-type: none"> <li>● <b>Outcome type:</b> ContinuousOutcome</li> </ul> <p><i>Arbejdsfastholdelse, Længste follow-up (min. ½ år)</i></p> <ul style="list-style-type: none"> <li>● <b>Outcome type:</b> DichotomousOutcome</li> </ul> <p><i>Selvmondsadfærd, Længste follow-up (min. ½ år)</i></p> <ul style="list-style-type: none"> <li>● <b>Outcome type:</b> DichotomousOutcome</li> <li>● <b>Direction:</b> Lower is better</li> </ul> <p><i>Responsrate, Efter endt behandling</i></p> <ul style="list-style-type: none"> <li>● <b>Outcome type:</b> DichotomousOutcome</li> <li>● <b>Direction:</b> Higher is better</li> </ul> <p><i>Hospitalsindlæggelser (antal), Længste follow-up (min. ½ år)</i></p> <ul style="list-style-type: none"> <li>● <b>Outcome type:</b> DichotomousOutcome</li> <li>● <b>Direction:</b> Lower is better</li> </ul> <p><i>Frafald/ All-cause discontinuation, Ved interventionens afslutning</i></p> <ul style="list-style-type: none"> <li>● <b>Outcome type:</b> DichotomousOutcome</li> <li>● <b>Direction:</b> Lower is better</li> </ul>
<b>Identification</b>	<p><b>Sponsorship source:</b> This research is funded by the research institute of Experimental Psychopathology (EPP), The Netherlands, and the Academic Community Mental Health Centre (RIAGG) in Maastricht, The Netherlands. Both organizations have no special interests in specific outcomes of the trial.</p> <p><b>Country:</b> The Netherlands</p> <p><b>Setting:</b> Outpatient mental health clinic in Maastricht</p> <p><b>Comments:</b></p> <p><b>Authors name:</b> Lemmens, 2015</p> <p><b>Institution:</b> Department of Clinical Psychological Science, Faculty of Psychology and Neuroscience</p> <p><b>Email:</b> Lotte.Lemmens@Maastrichtuniversity.nl</p> <p><b>Address:</b> Maastricht University, P.O. Box 616, Maastricht, The Netherlands</p>
<b>Notes</b>	<p><i>Henning Keinke Andersen on 11/12/2015 00:18</i></p> <p><b>Outcomes</b></p> <p>Jeg er usikker på N efter 12 måneder/endt behandling i begge grupper. Forfatterne noterer tydeligvis at samlet 25 deltagere (frafald) ikke afslutter efter 12 måneder, men der foreligger ikke en yderligere stratifikation. Jeg kan ikke finde den i artiklen, men der refereres til et datasuppl IV. Har ikke kunnet finde</p>

dette og derfor valgt at fratække 13 (CBT) resp. 12 (IPT) fra de to grupper. Dette er højst sandsynligt forkerte værdier. Der må nødvendigvis være data for remissionrater og responsrater (samt frafald) i dette data suppl. Jeg hæfter mig ved at forfatteren i diskussionen nævner at data var leveret af 85% af patienterne efter 12 måneder (igen uden stratifikation) så mht frafald vil dette betyde n=64 (IPT) resp 65 (CBT), men er sikkert anderledes i suppl.

## Risk of bias table

Bias	Authors' judgement	Support for judgement
Other sources of bias	Low risk	Judgement Comment: None known
Incomplete outcome data	Low risk	Judgement Comment: 'No significant differences in attrition rates emerged across conditions (See Consort Flow Chart)'. Missing outcome data is balanced in numbers across intervention groups. At 7 months (the end of the acute phase), 6 patients in CT and 10 in IPT were lost to follow-up. At 12 months this was 11 (14.5%) for CT and 14 (18.7%) for IPT. Reasons for drop-out were similar across groups. Patients either were unattainable/did not respond to contact requests (7 in CT vs. 8 in IPT), or no longer wanted to participate in the trial (3 in CT vs. 6 in IPT). 1 moved abroad (CT). Even though the 12-month attrition rates are within (the low) range of other clinical trials, they might have introduced bias, which could be a limitation of the study. However, we do not consider it likely that the drop-out rates have caused any large biases because missings were handled carefully. By using mixed regression (a method that takes the nested structure of the data into consideration and can deal with autocorrelation and missing values, see Singer & Willet, 2003, Oxford University Press).
Blinding of participants and personnel	High risk	Judgement Comment: With regard to the nature of interventions, blinding of patients and therapists for treatment condition was not possible'. However, we think it is unlikely that the lack of blinding has influenced outcome, mainly because all outcome measures were self-report measures, and patients were not aware of study aims. However, the fact that the researchers who conducted statistical analyses were not blind for the coding of CT and IPT is a limitation of the current study.
Selective outcome reporting	Low risk	Judgement Comment: We pre-specified all of the study's outcomes in our protocol paper (Lemmens et al., 2011). As can be seen in the protocol paper, we included several categories of measurements: primary and secondary outcome measures (in terms of symptoms and quality of life), process measures, and economic evaluation measures. The present study examines the clinical effectiveness, and therefore included all clinical outcome and quality of life measures.
Allocation concealment	Low risk	Judgement Comment: 'Randomization took place at the research center. The researcher pressed the 'assign' button on the computer screen, after which the database randomly allocated the participant to one of three conditions using computer-generated block

		randomization (10:10:4) The random allocation sequence was generated by an independent computer scientist and concealed from the researchers that were involved in the randomization procedure in order to prevent prediction of future assignment.'
Blinding of outcome assessors	High risk	
Sequence Generation	Low risk	Judgement Comment: Randomization took place at the research center. The researcher pressed the 'assign' button on the computer screen, after which the database randomly allocated the participant to one of three conditions using computer-generated block randomization (10:10:4) The random allocation sequence was generated by an independent computer scientist and concealed from the researchers that were involved in the randomization procedure in order to prevent prediction

Patient predictors of response to psychotherapy and pharmacotherapy: findings in the NIMH Treatment of Depression Collaborative Research Program.. The American journal of psychiatry 1991;148(8):997-1008. [DOI: 10.1176/ajp.148.8.997]

### **Weitz 2014**

Weitz E.; Hollon SD.; Kerkhof A.; Cuijpers P.. Do depression treatments reduce suicidal ideation? The effects of CBT, IPT, pharmacotherapy, and placebo on suicidality.. Journal of affective disorders 2014;167:98-103. [DOI: 10.1016/j.jad.2014.05.036]

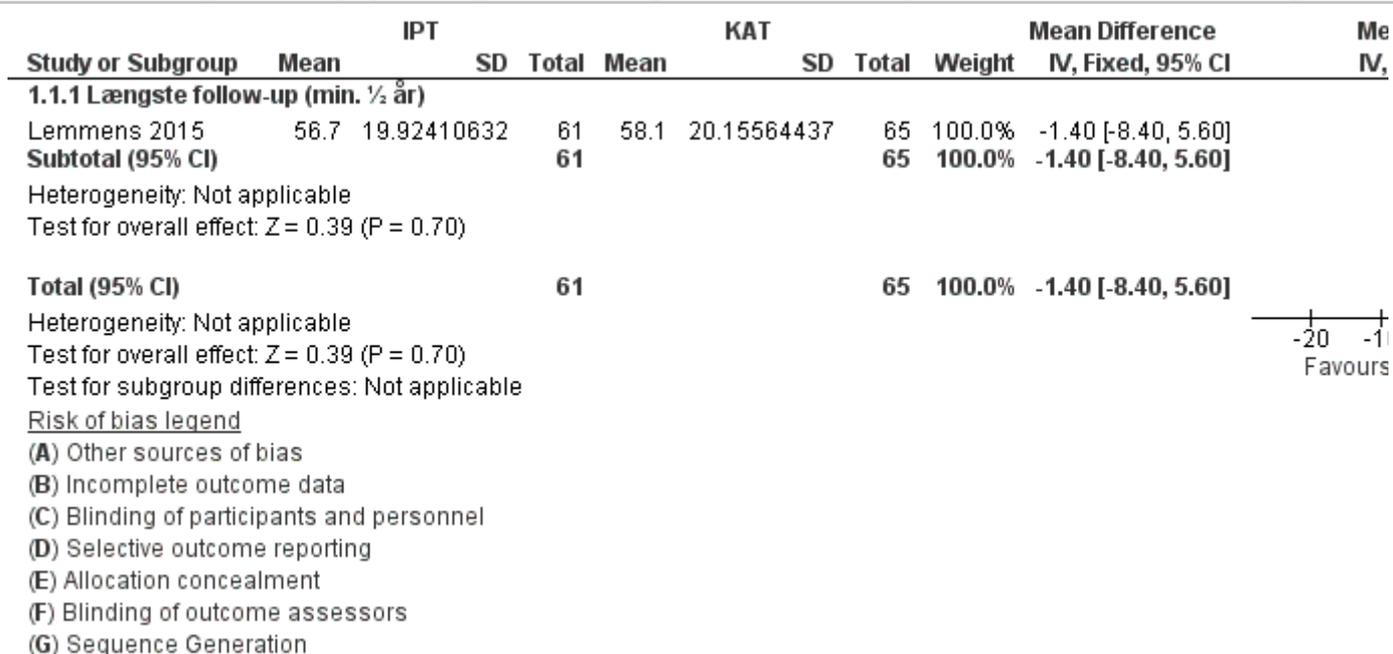

## Data and analyses

### 1 IPT vs KAT

Outcome or Subgroup	Studies	Participants	Statistical Method	Effect Estimate
1.1 Livskvalitet, Længste follow-up (min. ½ år)	1	126	Mean Difference (IV, Fixed, 95% CI)	-1.40 [-8.40, 5.60]
1.1.1 Længste follow-up (min. ½ år)	1	126	Mean Difference (IV, Fixed, 95% CI)	-1.40 [-8.40, 5.60]
1.2 Funktionsevne, Længste follow-up (min. ½ år)	2	208	Std. Mean Difference (IV, Random, 95% CI)	-0.05 [-0.32, 0.22]
1.3 Selvmordsadfærd, Længste follow-up (min. ½ år)	0	0	Mean Difference (IV, Fixed, 95% CI)	Not estimable
1.4 Remissionsrate, Efter endt behandling	5	551	Risk Ratio (IV, Random, 95% CI)	0.99 [0.82, 1.20]
1.5 Recidiv, Længste follow-up (min. ½ år)	2	79	Risk Ratio (IV, Random, 95% CI)	1.13 [0.57, 2.25]
1.6 Arbejdsfastholdelse, Længste follow-up (min. ½ år)	0		Risk Ratio (IV, Fixed, 95% CI)	No totals
1.7 Responstrate, Efter endt behandling	2		Risk Ratio (IV, Random, 95% CI)	Subtotals only
1.7.1 Efter endt behandling	2	213	Risk Ratio (IV, Random, 95% CI)	0.75 [0.57, 0.99]
1.8 Hospitalsindlæggelser (antal), Længste follow-up (min. ½ år)	0		Risk Ratio (IV, Fixed, 95% CI)	No totals
1.9 Frafald/ All-cause discontinuation, Ved interventionens afslutning	5	608	Risk Ratio (IV, Random, 95% CI)	0.91 [0.81, 1.01]
1.10 Selvmordsadfærd, Længste follow-up (min. ½ år)	0		Risk Ratio (IV, Fixed, 95% CI)	No totals

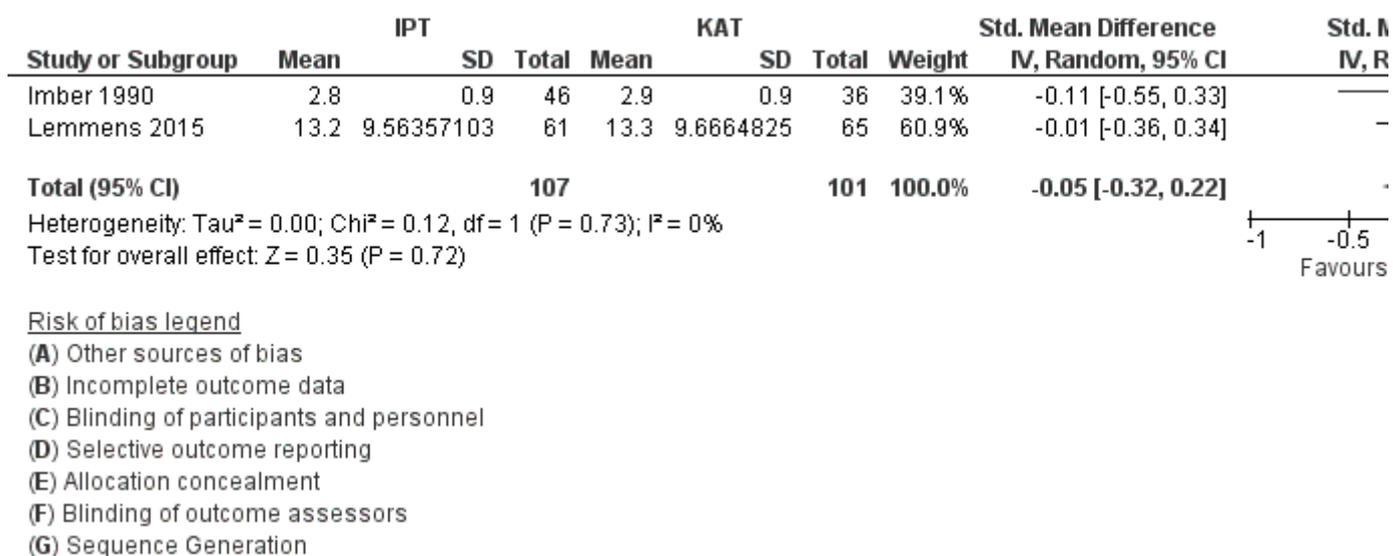

## Figures

### Figure 1 (Analysis 1.1)

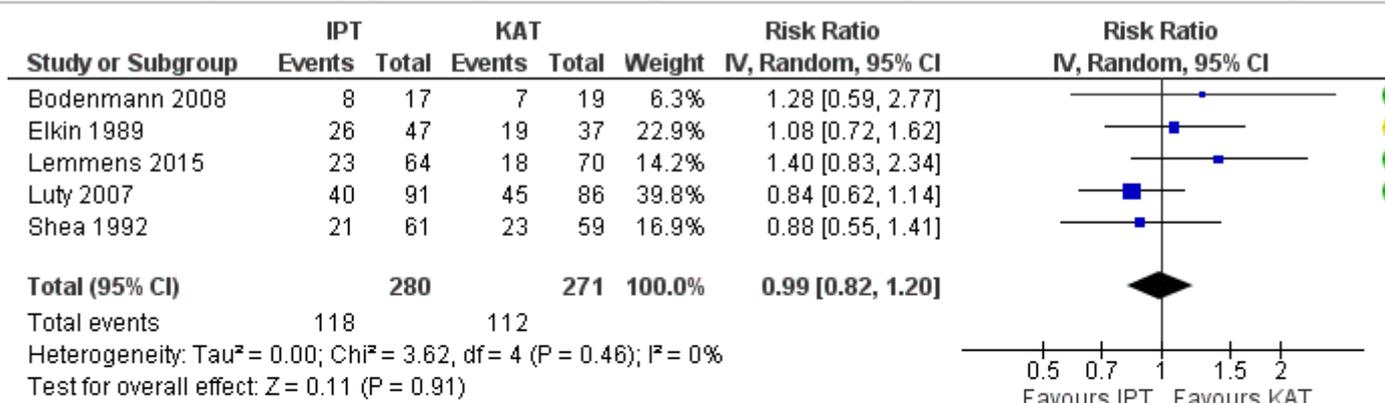

Forest plot of comparison: 1 IPT vs KAT, outcome: 1.1 Livskvalitet, Længste follow-up (min. ½ år).

### Figure 2 (Analysis 1.2)

Forest plot of comparison: 1 IPT vs KAT, outcome: 1.2 Funktionsevne, Længste follow-up (min. ½ år).

### Figure 3 (Analysis 1.4)

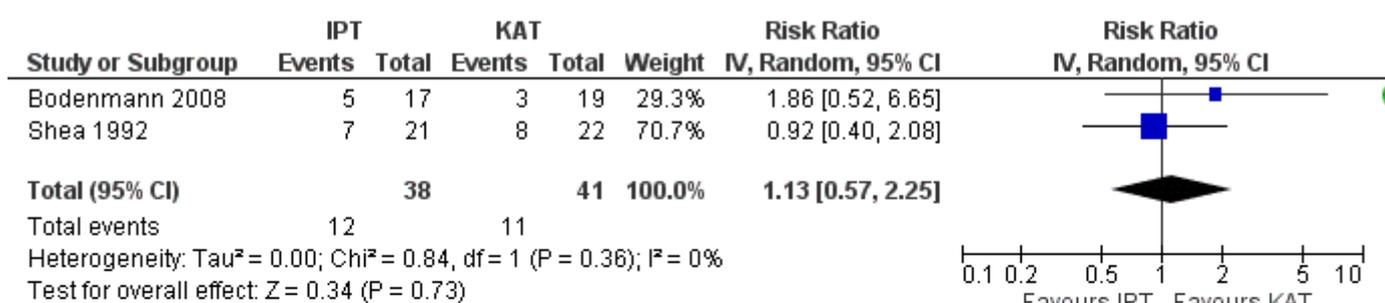

Risk of bias legend

- (A) Other sources of bias
- (B) Incomplete outcome data
- (C) Blinding of participants and personnel
- (D) Selective outcome reporting
- (E) Allocation concealment
- (F) Blinding of outcome assessors
- (G) Sequence Generation

Forest plot of comparison: 1 IPT vs KAT, outcome: 1.4 Remissionsrate, Efter endt behandling.

**Figure 4 (Analysis 1.5)**

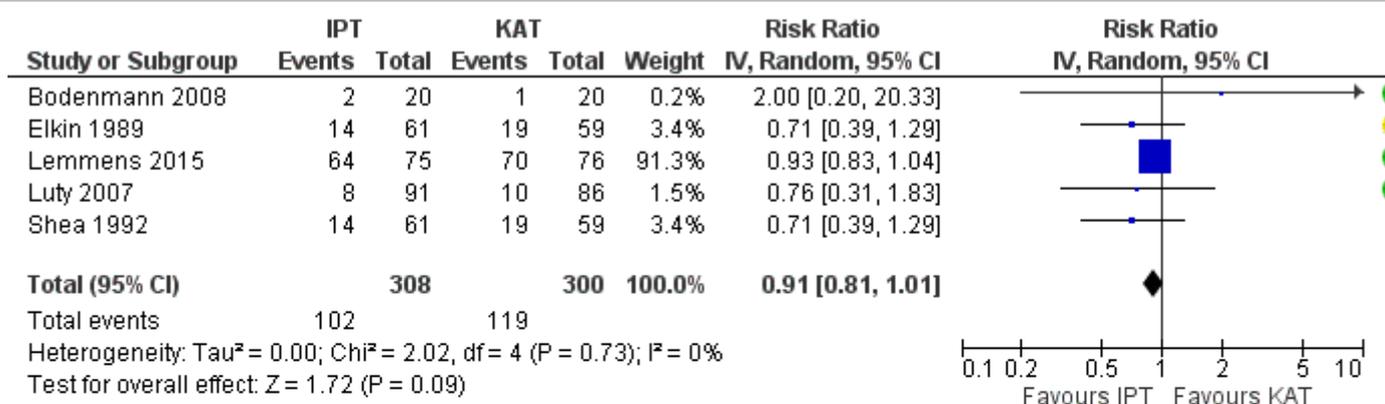

Risk of bias legend

- (A) Other sources of bias
- (B) Incomplete outcome data
- (C) Blinding of participants and personnel
- (D) Selective outcome reporting
- (E) Allocation concealment
- (F) Blinding of outcome assessors
- (G) Sequence Generation

Forest plot of comparison: 1 IPT vs KAT, outcome: 1.5 Recidiv, Længste follow-up (min. ½ år).

**Figure 5 (Analysis 1.9)**

Risk of bias legend

- (A) Other sources of bias
- (B) Incomplete outcome data
- (C) Blinding of participants and personnel
- (D) Selective outcome reporting
- (E) Allocation concealment
- (F) Blinding of outcome assessors
- (G) Sequence Generation

Forest plot of comparison: 1 IPT vs KAT, outcome: 1.9 Frafald/ All-cause discontinuation, Ved interventionens afslutning.
